

Your idle machine earns **while you sleep**.

La Piazza is a town square where ordinary people make real things — a voiceover, a postcard, a video, a 3D print — by running tested **recipes**. The thinking is shared and cheap. The *making* runs on hardware — ours, or **yours**. Lend your machine, run the recipes, earn credits. No frontier-model bill, no rules changing under you.

SWAP FREELY Your brain. Your hardware.

Use any AI model (or our shared one), run on any capable machine. Both are interchangeable — the recipe stays in command.

NO GPU NEEDED A normal laptop does plenty.

Three small free tools (~1 GB) cover most of it. A voiceover video renders in ~2 seconds on a plain CPU.

THE HEAVY TIER A gaming rig unlocks more.

A real graphics card runs the recipes a laptop can't — and earns the most credits.

Lend a GPU — earn credits

Got a gaming PC that sits dark most of the day? Plug it into La Piazza. One command, nothing on your machine is exposed, unplug whenever. It quietly makes things for the square and earns you credits — costs you nothing but the electricity you'd spend anyway. **So... why wouldn't you?**

1

Pick a recipe

Choose from the tested catalog — no code, no prompts to write.

2

It runs on capable hardware

The square matches your job to a machine that can run it. No surprises.

3

Get a finished file

A real result, every time. Lend your machine and you earn while others create.

Your own currency, fair and simple. 1 credit = 1,000 tokens of brain work — pegged to real work, not a speculative coin, auditable by a kid. Spend credits anywhere in the square; earn them by lending your machine or helping a neighbour. **We make our own money, and it balances itself.**
