

Your data is safe — and it's yours

Banco POS · Data protection & business continuity, in plain language

LA PIAZZA · BANCO
the counter that has your back

Backed up

Every night, and before every update

Encrypted

AES-256, in three separate places

Yours to take

Full export, anytime — no lock-in

HOW YOUR SHOP'S DATA IS PROTECTED

- ✓ **A full encrypted backup runs every night** at 03:00 — automatically, no one has to remember.
- ✓ **And again before every software update**, so a change can always be undone.
- ✓ **Stored in three independent places** — the live server, an off-site laptop, and encrypted cloud storage. Losing any one of them loses nothing.
- ✓ **Every backup is test-restored, not just saved** — the system reloads each copy and checks the sales, products and line-items match, so a backup is *proven*, not assumed. (Latest drill: 61 sales / 5,200 products / 190 lines matched.)
- ✓ **Strong encryption (GPG AES-256)**. The key lives in a master-password vault — the backups are unreadable to anyone else, including the cloud provider.
- ✓ **Kept for 30 days**, so you can roll back to any recent day, not just last night.

IF THE WORST HAPPENS

The server dies

Your latest encrypted copy is restored onto a fresh server, following a written step-by-step recovery runbook. Your catalog and sales come back.

Data gets corrupted

Roll back to the last known-good backup from the 30-day history. Because every copy is test-restored, we already know it's clean.

You decide to leave

You get a complete export of your catalog and sales. It's your data — you walk away with it, no hostage-taking.

HOW MUCH COULD YOU LOSE?

At most a day — usually less

Nightly backups, plus an extra snapshot before every update.

HOW FAST ARE YOU BACK?

Database in under a minute

Proven nightly by an automatic test-restore. A full new-server rebuild follows the written runbook.

YOU'RE NEVER LOCKED IN

- ✓ **Your data is exportable at any time** (catalog + sales), in standard formats your accountant can read.
- ✓ **A documented disaster-recovery procedure exists** — the recovery isn't in one person's head, it's written down and rehearsed.
- ✓ **Straight answer to "what if the vendor disappears?"** — you still hold a full copy of your own data and the runbook to restore it elsewhere. Continuity does not depend on trust alone.

STRAIGHT TALK — WHAT THIS IS AND ISN'T

Banco today runs on a single, well-backed-up server, so a *full* server rebuild takes hours (following the runbook), not the sub-minute database restore above. Card-terminal integration is in progress; some setups still enter card payments on your existing terminal. Everything above is measured and real — ask, and we'll show you a live restore.
